Be safe with
VALIDAS

Google Test

Before safety-critical software can be released, it needs to thoroughly tested. Undetected errors could lead to serious injury of the user and people in the vicinity of the product. The goal of the tool GoogleTest is to facilitate and automate testing of software. Therefore, the outputs of this tool are highly critical to determine if the software is fit to be released. To ensure that GoogleTest (Gtest) produces correct and reliable results in your environment, Validas developed the Gtest Qualification Kit (QKit).

Key benefits of using the QKit:

- is owned & frequently extended by Validas
- can be easily adapted to your configuration
- automatically executes and analyzes the necessary tests
- produces safety-standard compliant documentation
- is a perfect basis for easy certification

According to your business needs, Validas offers:

- personalized sets of qualification documentation
- the QKt for independent & fast requalification
- the extension of the qualification, if necessary

The QR code will lead you to more information and examples for the Validas GoogleTest Qualification Kit! If you have more questions, please write to us at: **gtest@validas.de**
